Bottom-Up Parsing

Approach:

1. Given $G \in CFG_\Sigma$, construct a nondeterministic bottom-up parsing automaton (NBA) which accepts $L(G)$ and which additionally computes corresponding (reversed) rightmost analyses
   - input alphabet: Σ
   - pushdown alphabet: X
   - output alphabet: $[p]$ (where $p := |P|$)
   - state set: omitted
   - transitions:

     shift: shifting input symbols onto the pushdown

     reduce: replacing the right-hand side of a production by its left-hand side (= inverse expansion steps)
2. Remove nondeterminism by allowing lookahead on the input: $G \in LR(k)$ iff $L(G)$ recognizable by deterministic bottom-up parsing automaton with lookahead of k symbols

Nondeterministic Bottom-Up Automaton

Definition (Nondeterministic bottom-up parsing automaton)

Let $G = \langle N, \Sigma, P, S \rangle \in CFG_\Sigma$. The nondeterministic bottom-up parsing automaton of G, $\mathrm{NBA}(G)$, is defined by the following components.

- Input alphabet: Σ
- Pushdown alphabet: X
- Output alphabet: $[p]$
- Configurations: $\Sigma^* \times X^* \times [p]^*$ (top of pushdown to the right)
- Transitions for $w \in \Sigma^*$, $\alpha \in X^*$, and $z \in [p]^*$:
  shifting steps: $(aw, \alpha, z) \vdash (w, \alpha a, z)$ if $a \in \Sigma$
  reduction steps: $(w, \alpha\beta, z) \vdash (w, \alpha A, zi)$ if $\pi_i = A \to \beta$
- Initial configuration for $w \in \Sigma^*$: $(w, \varepsilon, \varepsilon)$
- Final configurations: $\{\varepsilon\} \times \{S\} \times [p]^*$

Theorem 9.1 (Correctness of $\mathrm{NBA}(G)$)

Let $G = \langle N, \Sigma, P, S\rangle \in CFG_\Sigma$ and $\mathrm{NBA}(G)$ as before. Then, for every $w \in \Sigma^*$ and $z \in [p]^*$,

$$(w, \varepsilon, \varepsilon) \vdash^* (\varepsilon, S, z) \quad \textit{iff} \quad \overleftarrow{z} \textit{ is a rightmost analysis of } w$$

Nondeterminisn in $\mathrm{NBA}(G)$

Observation: $\mathrm{NBA}(G)$ is generally nondeterministic

- Shift or reduce? Example:

$$(bw, \alpha a, z) \vdash \begin{cases} (w, \alpha ab, z) \\ (bw, \alpha A, zi) \end{cases} \text{if } \pi_i = A \to a$$

Resolving Termination Nondeterminism I

General assumption to avoid nondeterminism of last type:
every grammar is start separated

Definition 9.2 (Start separation)

A grammar $G = \langle N, \Sigma, P, S \rangle \in CFG_\Sigma$ is called start separated if S only occurs in productions of the form $S \to A$ where $A \neq S$.

General assumption to avoid nondeterminism of last type:
every grammar is start separated

Definition 9.2 (Start separation)

A grammar $G = \langle N, \Sigma, P, S\rangle \in CFG_\Sigma$ is called start separated if S only occurs in productions of the form $S \to A$ where $A \neq S$.

Remarks:

- Start separation always possible by adding $S' \to S$ with new start symbol S'
- From now on consider only reduced grammars of this form ($\pi_0 := S' \to S$)

Resolving Termination Nondeterminism II

Start separation removes last form of nondeterminism ("When to terminate parsing?"):

Lemma 9.3

If $G \in CFG_\Sigma$ is start separated, then no successor of a final configuration (ε, S', z) in $\mathrm{NBA}(G)$ is again a final configuration.
(Thus parsing should be stopped in the first final configuration.)

(Thus parsing should be stopped in the first final configuration.)

Proof.

- To (ε, S', z), only reductions by ε-productions can be applied:

$$(\varepsilon, S', z) \vdash (\varepsilon, S'A, zi) \quad \text{if } \pi_i = A \to \varepsilon$$

Outline

$LR(k)$ Grammars I

Goal: resolve remaining nondeterminism of $\mathrm{NBA}(G)$ by supporting lookahead of $k \in \mathbb{N}$ symbols on the input

$\Longrightarrow$ $LR(k)$: reading of input from left to right with k-lookahead, computing a rightmost analysis

$LR(k)$ Grammars I

Goal: resolve remaining nondeterminism of $\mathrm{NBA}(G)$ by supporting lookahead of $k \in \mathbb{N}$ symbols on the input

$\Longrightarrow$ $LR(k)$: reading of input from left to right with k-lookahead, computing a rightmost analysis

Definition 9.4 ($LR(k)$ grammar)

Let $G = \langle N, \Sigma, P, S\rangle \in CFG_\Sigma$ be start separated and $k \in \mathbb{N}$. Then G has the $LR(k)$ property (notation: $G \in LR(k)$) if for all rightmost derivations of the form

$$S \begin{cases} \Rightarrow_r^* \alpha A w \Rightarrow_r \alpha\beta w \\ \Rightarrow_r^* \gamma B x \Rightarrow_r \alpha\beta y \end{cases}$$

such that $\mathrm{first}_k(w) = \mathrm{first}_k(y)$, it follows that $\alpha = \gamma$, $A = B$, and $x = y$.

Remarks:

- If $G \in LR(k)$, then the reduction of $\alpha\beta w$ to $\alpha A w$ is already determined by $\mathrm{first}_k(w)$.
- Therefore $\mathrm{NBA}(G)$ in configuration $(w, \alpha\beta, z)$ can decide to reduce and how to reduce.

Remarks:

- If $G \in LR(k)$, then the reduction of $\alpha\beta w$ to $\alpha A w$ is already determined by $\mathrm{first}_k(w)$.
- Therefore $\mathrm{NBA}(G)$ in configuration $(w, \alpha\beta, z)$ can decide to reduce and how to reduce.
- Computation of $\mathrm{NBA}(G)$ for $S \Rightarrow_r^* \alpha A w \Rightarrow_r \alpha\beta w$:

$$(w'w, \varepsilon, \varepsilon) \vdash^* (w, \alpha\beta, z) \overset{\text{red } i}{\vdash} (w, \alpha A, zi) \vdash \ldots$$

where $\pi_i = A \to \beta$

Remarks:

- If $G \in LR(k)$, then the reduction of $\alpha\beta w$ to $\alpha A w$ is already determined by $\mathrm{first}_k(w)$.
- Therefore $\mathrm{NBA}(G)$ in configuration $(w, \alpha\beta, z)$ can decide to reduce and how to reduce.
- Computation of $\mathrm{NBA}(G)$ for $S \Rightarrow_r^* \alpha A w \Rightarrow_r \alpha\beta w$:

  $$(w'w, \varepsilon, \varepsilon) \vdash^* (w, \alpha\beta, z) \overset{\text{red } i}{\vdash} (w, \alpha A, zi) \vdash \dots$$

  where $\pi_i = A \to \beta$
- Computation of $\mathrm{NBA}(G)$ for $S \Rightarrow_r^* \gamma B x \Rightarrow_r \alpha\beta y$:
  - with direct reduction ($y = x$, $\alpha\beta = \gamma\delta$, $\pi_j = B \to \delta$):

  $$(y'y, \varepsilon, \varepsilon) \vdash^* (y, \alpha\beta, z') = (x, \gamma\delta, z') \overset{\text{red } j}{\vdash} (x, \gamma B, z'j) \vdash \dots$$

Remarks:

- If $G \in LR(k)$, then the reduction of $\alpha\beta w$ to $\alpha A w$ is already determined by $\mathrm{first}_k(w)$.
- Therefore $\mathrm{NBA}(G)$ in configuration $(w, \alpha\beta, z)$ can decide to reduce and how to reduce.
- Computation of $\mathrm{NBA}(G)$ for $S \Rightarrow_r^* \alpha A w \Rightarrow_r \alpha\beta w$:
  $$(w'w, \varepsilon, \varepsilon) \vdash^* (w, \alpha\beta, z) \overset{\text{red } i}{\vdash} (w, \alpha A, zi) \vdash \ldots$$
  where $\pi_i = A \to \beta$
- Computation of $\mathrm{NBA}(G)$ for $S \Rightarrow_r^* \gamma B x \Rightarrow_r \alpha\beta y$:
  - with direct reduction ($y = x$, $\alpha\beta = \gamma\delta$, $\pi_j = B \to \delta$):
    $$(y'y, \varepsilon, \varepsilon) \vdash^* (y, \alpha\beta, z') = (x, \gamma\delta, z') \overset{\text{red } j}{\vdash} (x, \gamma B, z'j) \vdash \ldots$$
  - with previous shifts ($y = x'x$, $\alpha\beta x' = \gamma\delta$, $\pi_j = B \to \delta$):
    $$\begin{aligned}(y'y, \varepsilon, \varepsilon) &\vdash^* (y, \alpha\beta, z') = (x'x, \alpha\beta, z') \\ &\overset{\text{shift}^*}{\vdash} (x, \alpha\beta x', z') = (x, \gamma\delta, z') \\ &\overset{\text{red } j}{\vdash} (x, \gamma B, z'j) \vdash \ldots\end{aligned}$$

Outline

$LR(0)$ Grammars

The case $k = 0$ is relevant (in contrast to $LL(0)$): here the decision is just based on the contents of the pushdown, without any lookahead.

$LR(0)$ Grammars

The case $k = 0$ is relevant (in contrast to $LL(0)$): here the decision is just based on the contents of the pushdown, without any lookahead.

Corollary 9.5 ($LR(0)$ grammar)

$G \in CFG_\Sigma$ has the $LR(0)$ property if for all rightmost derivations of the form

$$S \begin{cases} \Rightarrow_r^* \alpha A w \Rightarrow_r \alpha\beta w \\ \Rightarrow_r^* \gamma B x \Rightarrow_r \alpha\beta y \end{cases}$$

it follows that $\alpha = \gamma$, $A = B$, and $x = y$.

$LR(0)$ Grammars

The case $k = 0$ is relevant (in contrast to $LL(0)$): here the decision is just based on the contents of the pushdown, without any lookahead.

Corollary 9.5 ($LR(0)$ grammar)

$G \in CFG_\Sigma$ has the $LR(0)$ property if for all rightmost derivations of the form

$$S \begin{cases} \Rightarrow_r^* \alpha A w \Rightarrow_r \alpha\beta w \\ \Rightarrow_r^* \gamma B x \Rightarrow_r \alpha\beta y \end{cases}$$

it follows that $\alpha = \gamma$, $A = B$, and $x = y$.

Goal: derive a finite information from the pushdown which suffices to resolve the nondeterminism (similar to abstraction of right context in LL parsing by fo-sets)

Theorem 9.11 (Computing $LR(0)$ sets)

Let $G = \langle N, \Sigma, P, S\rangle \in CFG_\Sigma$ *be start separated by* $S' \to S$ *and reduced.*

1. $LR(0)(\varepsilon)$ *is the least set such that*
   - $[S' \to \cdot S] \in LR(0)(\varepsilon)$ *and*
   - *if* $[A \to \cdot B\gamma] \in LR(0)(\varepsilon)$ *and* $B \to \beta \in P$, *then* $[B \to \cdot\beta] \in LR(0)(\varepsilon)$.
