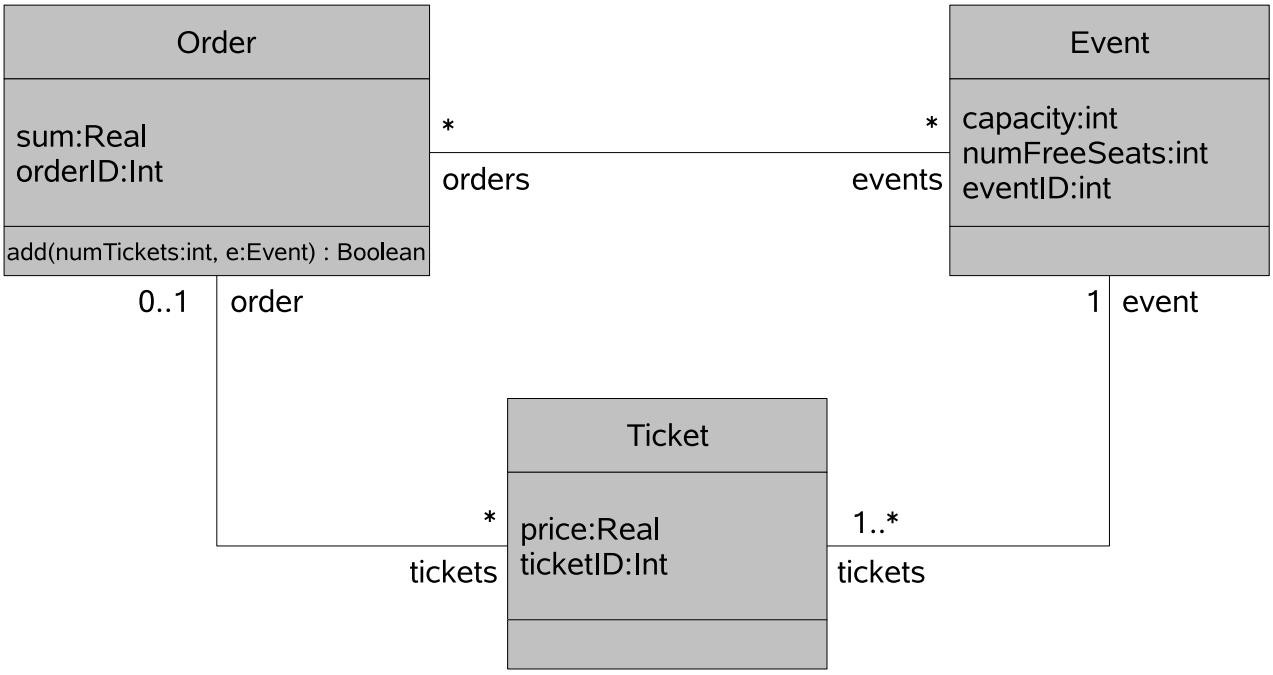
Winter Term 07/08

– Assignment 7 –

Hand in until February 6th before the exercise class.

Exercise 1 (10 points)

Let the following class diagram be given:



It is part of a ticket reservation system where a user can order tickets for events like cinema films or theater or cabaret performances.

a) Describe the following statements as OCL invariants:

   i) The attribute `sum` must not be negative.

   ii) The attribute `sum` is 0 if no tickets are ordered.

   iii) The attribute `sum` exactly describes the prize of the tickets ordered.

   iv) Different instances of `Ticket` have different order numbers.

   v) Each `Event` has at least 0 free seats.

   vi) An `Event`'s capacity (i.e., the total number of seats) is greater than the number of all ordered tickets of this event.

b) Describe the pre- and post conditions of method `add`, which adds a number of `num` tickets to the order if there are still enough free seats and in this case increases the sum correctly. In case there are not enough seats nothing is done.

Exercise 2 **(10 points)**

Given the class diagram from exercise 1, a concrete instance of the system is being created. There are two events: a film *Dumbo* and a theater performance called *The Magic Flute*. The film has got two categories: two cheap tickets for 5 Euro, each and two more expensive ones for 10 Euros, each. The theater seats are divided into 5 categories. There is a ticket for 20, 40, 60, 80 and 100 Euros. The film has got a capacity of 4 but there are already two seats occupied by an order O_0 which includes a ticket for 5 and one for 10 Euros. Moreover O_0 contains the most expensive ticket for the theater event. From now on cheaper tickets are sold first (e.g., the first ticket to be sold for the film *Dumbo* is a 5 Euro ticket).

a) Draw the system's "initial" configuration which is described above.

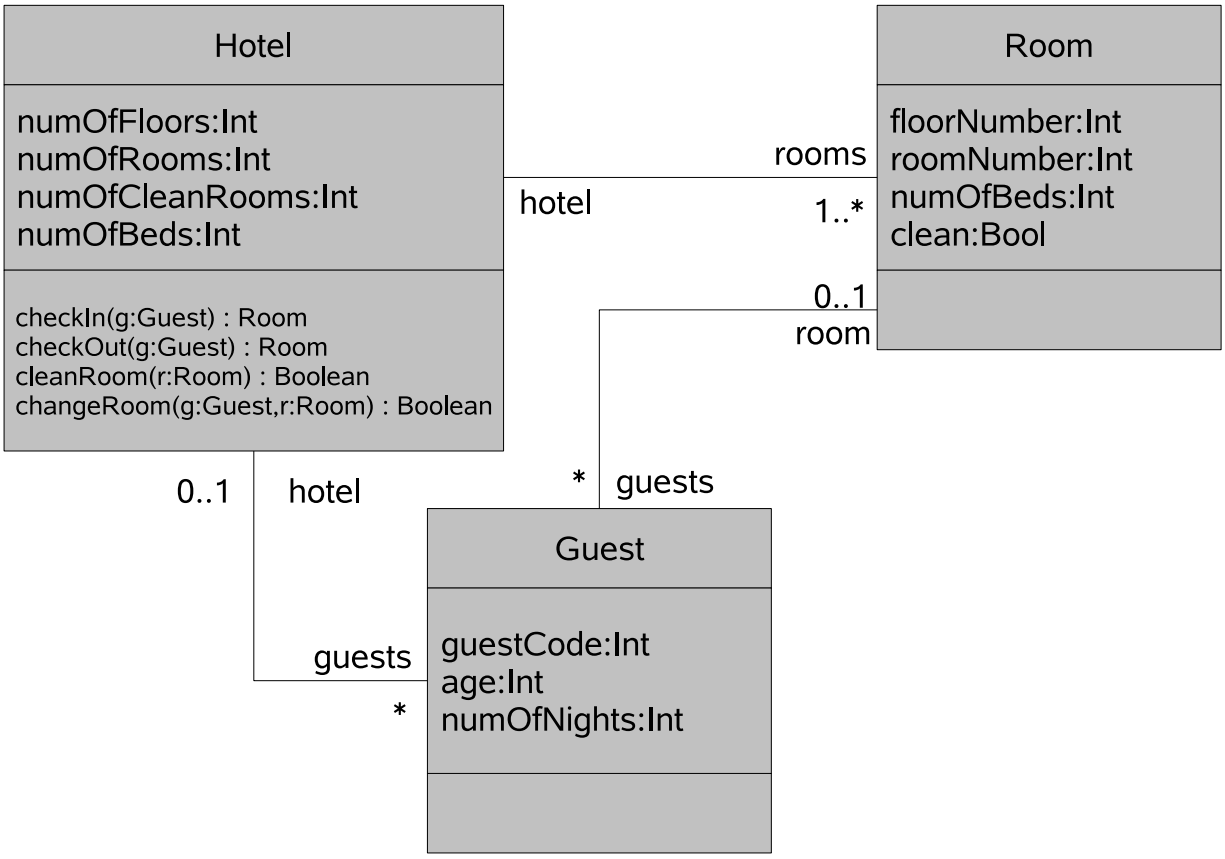
b) Draw the system's configuration after each of the following actions:

   (a) A new `order` O_1 is created. For this order:
      i) Buy a ticket for *The Magic Flute*.
      ii) Buy a ticket for the film *Dumbo*.

   (b) A new `order` O_2 is created. For this order:
      iii) Buy two tickets for the film *Dumbo*.
      iv) Buy three tickets for *The Magic Flute*.

Exercise 3 (20 **points**)

Given the following, slightly extended, version of the class diagram from the lecture:



Determine the formal semantics of the following OCL statements (i.e., translate the OCL statements into BOTL according to the rules from the lecture).

a) invariant:

```
context Hotel
inv:  guests→size ≤ numOfBeds
```

b) invariant:

```
context Hotel
inv:  numOfBeds = rooms→iterate(r ; x=0 | x+r.numOfBeds)
```

c) pre and post condition:

```
context Hotel::cleanRoom(r:Room)
pre:   (not r.clean = tt) and r.guests→size = 0
post:  r.clean = tt and
       numOfCleanRooms = numOfCleanRooms@pre + 1
```

d) pre and post condition:

```
context Hotel::changeRoom(g:Guest, r:Room)
pre:   guests→contains(g) and r.guests→size < r.numOfBeds
post:  g.room.guests→size = g.room.guests@pre→size - 1 and
       r.guests→size = r.guests@pre→size + 1 and
       g.room = r
```
