

Static Program Analysis

Lecture 1: Introduction to Program Analysis

Thomas Noll

Lehrstuhl für Informatik 2
(Software Modeling and Verification)

RWTH Aachen University

`noll@cs.rwth-aachen.de`

`http://www-i2.informatik.rwth-aachen.de/i2/spa11/`

Summer Semester 2011

- 1 Preliminaries
- 2 Introduction
- 3 The Imperative Model Language WHILE
- 4 Overview of the Lecture

- Lectures: **Thomas Noll**
 - Lehrstuhl für Informatik 2, Room 4211
 - `noll@cs.rwth-aachen.de`
- Exercise classes:
 - **Jonathan Heinen** (`heinen@cs.rwth-aachen.de`)
 - **Christina Jansen** (`christina.jansen@cs.rwth-aachen.de`)
- Student assistant:
 - **Stefan Breuer**

- MSc Informatik:
 - Theoretische Informatik
- MSc Software Systems Engineering:
 - Theoretical CS
 - Specialization *Formal Methods, Programming Languages and Software Validation*
- Diplomstudiengang Informatik:
 - Theoretische Informatik
 - Vertiefungsfach *Formale Methoden, Programmiersprachen und Softwarevalidierung*
 - Combination with Katoen, Thomas, Vöcking, ...

- What **you** can expect:
 - Foundations of static analysis of computer software
 - Implementation and tool support
 - Applications in, e.g., program optimization and software validation

- What **you** can expect:
 - Foundations of static analysis of computer software
 - Implementation and tool support
 - Applications in, e.g., program optimization and software validation
- What **we** expect: basic knowledge in
 - Programming (essential concepts of imperative and object-oriented programming languages and elementary programming techniques)
 - helpful: Theory of Programming (such as Semantics of Programming Languages or Software Verification)

- **Schedule:**

- Lecture Wed 10:00–11:30 AH 6 (starting April 6)
- Lecture Thu 15:00–16:30 AH 5 (bi-weekly; starting April 14)
- Exercise class Wed 10:00–11:30 AH 2 (starting April 18)
- see overview at <http://www-i2.informatik.rwth-aachen.de/i2/spa11/>

- **Schedule:**
 - Lecture Wed 10:00–11:30 AH 6 (starting April 6)
 - Lecture Thu 15:00–16:30 AH 5 (bi-weekly; starting April 14)
 - Exercise class Wed 10:00–11:30 AH 2 (starting April 18)
 - see overview at <http://www-i2.informatik.rwth-aachen.de/i2/spa11/>
- **0th assignment sheet** next week, presented April 18
- Work on assignments in **groups of three**

- **Schedule:**
 - Lecture Wed 10:00–11:30 AH 6 (starting April 6)
 - Lecture Thu 15:00–16:30 AH 5 (bi-weekly; starting April 14)
 - Exercise class Wed 10:00–11:30 AH 2 (starting April 18)
 - see overview at <http://www-i2.informatik.rwth-aachen.de/i2/spa11/>
- **0th assignment sheet** next week, presented April 18
- Work on assignments in **groups of three**
- **Oral exam** on appointment
 - for MSc candidates (6 credits)
 - for Diplom candidates (Übungsschein)
- **Admission** requires at least 50% of the points in the exercises

- **Schedule:**
 - Lecture Wed 10:00–11:30 AH 6 (starting April 6)
 - Lecture Thu 15:00–16:30 AH 5 (bi-weekly; starting April 14)
 - Exercise class Wed 10:00–11:30 AH 2 (starting April 18)
 - see overview at <http://www-i2.informatik.rwth-aachen.de/i2/spa11/>
- **0th assignment sheet** next week, presented April 18
- Work on assignments in **groups of three**
- **Oral exam** on appointment
 - for MSc candidates (6 credits)
 - for Diplom candidates (Übungsschein)
- **Admission** requires at least 50% of the points in the exercises
- Written material in **English**, lecture and exercise classes “on demand”, rest up to you

- 1 Preliminaries
- 2 Introduction
- 3 The Imperative Model Language WHILE
- 4 Overview of the Lecture

What Is It All About?

Static (Program) Analysis

Static analysis is a general method for **automated reasoning** on requirements, design models, and **programs**.

What Is It All About?

Static (Program) Analysis

Static analysis is a general method for **automated reasoning** on requirements, design models, and **programs**.

Distinguishing features:

Static: based on source code, not on (dynamic) execution
(in contrast to testing or run-time verification)

Automated: “push-button” technology, i.e., little user intervention
(in contrast to theorem-proving approaches)

What Is It All About?

Static (Program) Analysis

Static analysis is a general method for **automated reasoning** on requirements, design models, and **programs**.

Distinguishing features:

Static: based on source code, not on (dynamic) execution
(in contrast to testing or run-time verification)

Automated: “push-button” technology, i.e., little user intervention
(in contrast to theorem-proving approaches)

(Main) Applications:

Optimizing compilers: exploit program properties to improve **runtime or memory efficiency** of generated code
(dead code elimination, constant propagation, ...)

Software validation: verify **program correctness**
(bytecode verification, shape analysis, ...)

Dream of Static Program Analysis

Program

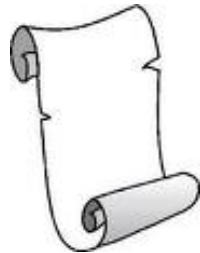

```
private Sub InitializeComponent()  
    On Error Resume Next  
    On Error Goto ErrorHandler  
    Select Case Button.Key  
        Case "Back"  
            brwWebBrowser.Go  
        Case "Forward"  
            brwWebBrowser.  
        Case "Refresh"  
            brwWebBrows  
        Case "Home"  
            WebBro
```

Result

Property specification

Theorem 1.1 (Theorem of Rice (1953))

*All non-trivial semantic questions about programs from a universal programming language are **undecidable**.*

Theorem 1.1 (Theorem of Rice (1953))

*All non-trivial semantic questions about programs from a universal programming language are **undecidable**.*

Example 1.2 (Detection of constants)

<code>read(x);</code>		<code>read(x);</code>
<code>if x > 0 then</code>		<code>if x > 0 then</code>
<code> P;</code>		<code> P;</code>
<code> y := x;</code>	$\sim$	<code> y := x;</code>
<code>else</code>		<code>else</code>
<code> y := 1;</code>		<code> y := 1;</code>
<code>end;</code>		<code>end;</code>
<code>write(y);</code>		<code>write(1);</code>

`write(y)` can be equivalently replaced by some constant `write(1)`
iff program P does never terminate

Fundamental Limits

Theorem 1.1 (Theorem of Rice (1953))

*All non-trivial semantic questions about programs from a universal programming language are **undecidable**.*

Example 1.2 (Detection of constants)

<pre>read(x); if x > 0 then P; y := x; else y := 1; end; write(y);</pre>	$\sim$	<pre>read(x); if x > 0 then P; y := x; else y := 1; end; write(1);</pre>
---	--------	---

`write(y)` can be equivalently replaced by some constant `write(1)`
iff program P does never terminate

Thus: constant detection is **undecidable**

① Weaker models:

- employ **abstract models** of systems
 - finite automata, labeled transition systems, ...
- perform **exact analyses**
 - model checking, theorem proving, ...

① Weaker models:

- employ **abstract models** of systems
 - finite automata, labeled transition systems, ...
- perform **exact analyses**
 - model checking, theorem proving, ...

② **Weaker analyses** (here)

- employ **concrete models** of systems
 - source code
- perform **approximate analyses**
 - dataflow analysis, abstract interpretation, type checking, ...

- **Soundness:**

- Predicted results must apply to every system execution
- Examples:
 - constant detection: replacing expression by appropriate constant does not change program results
 - pointer analysis: analysis finds pointer variable $x \neq 0$
 $\implies$ no run-time exception when dereferencing x
- Absolutely mandatory for **trustworthiness** of analysis results!

• Soundness:

- Predicted results must apply to every system execution
- Examples:
 - constant detection: replacing expression by appropriate constant does not change program results
 - pointer analysis: analysis finds pointer variable $x \neq 0$
 $\implies$ no run-time exception when dereferencing x
- Absolutely mandatory for **trustworthiness** of analysis results!

• Completeness:

- Behavior of every system execution caught by analysis
- Examples:
 - program always terminates $\implies$ analysis must be able to detect
 - value of variable in $[0, 255]$ $\implies$ interval analysis finds out
- Usually not guaranteed due to approximation
- Degree of completeness determines **quality** of analysis

• Soundness:

- Predicted results must apply to every system execution
- Examples:
 - constant detection: replacing expression by appropriate constant does not change program results
 - pointer analysis: analysis finds pointer variable $x \neq 0$
 $\implies$ no run-time exception when dereferencing x
- Absolutely mandatory for **trustworthiness** of analysis results!

• Completeness:

- Behavior of every system execution caught by analysis
- Examples:
 - program always terminates $\implies$ analysis must be able to detect
 - value of variable in $[0, 255]$ $\implies$ interval analysis finds out
- Usually not guaranteed due to approximation
- Degree of completeness determines **quality** of analysis

• **Correctness** := Soundness $\wedge$ Completeness

(often for logical axiomatizations and such, usually not guaranteed for program analyses)

- 1 Preliminaries
- 2 Introduction
- 3 The Imperative Model Language WHILE
- 4 Overview of the Lecture

WHILE: simple imperative programming language without procedures or advanced data structures

WHILE: simple imperative programming language without procedures or advanced data structures

Syntactic categories:

Category	Domain	Meta variable
Numbers	$\mathbb{Z} = \{0, 1, -1, \dots\}$	z
Truth values	$\mathbb{B} = \{\text{true}, \text{false}\}$	t
Variables	$Var = \{x, y, \dots\}$	x
Arithmetic expressions	$AExp$ (next slide)	a
Boolean expressions	$BExp$ (next slide)	b
Commands (statements)	Cmd (next slide)	c

Definition 1.3 (Syntax of WHILE)

The **syntax of WHILE Programs** is defined by the following context-free grammar:

$$a ::= z \mid x \mid a_1 + a_2 \mid a_1 - a_2 \mid a_1 * a_2 \in AExp$$
$$b ::= t \mid a_1 = a_2 \mid a_1 > a_2 \mid \neg b \mid b_1 \wedge b_2 \mid b_1 \vee b_2 \in BExp$$
$$c ::= \text{skip} \mid x := a \mid c_1 ; c_2 \mid \text{if } b \text{ then } c_1 \text{ else } c_2 \mid \text{while } b \text{ do } c \in Cmd$$

Definition 1.3 (Syntax of WHILE)

The **syntax of WHILE Programs** is defined by the following context-free grammar:

$$a ::= z \mid x \mid a_1 + a_2 \mid a_1 - a_2 \mid a_1 * a_2 \in AExp$$
$$b ::= t \mid a_1 = a_2 \mid a_1 > a_2 \mid \neg b \mid b_1 \wedge b_2 \mid b_1 \vee b_2 \in BExp$$
$$c ::= \text{skip} \mid x := a \mid c_1 ; c_2 \mid \text{if } b \text{ then } c_1 \text{ else } c_2 \mid \text{while } b \text{ do } c \in Cmd$$

Remarks: we assume that

- the syntax of numbers, truth values and variables is predefined (i.e., no “lexical analysis”)
- the syntax of ambiguous constructs is uniquely determined (by brackets, priorities, or indentation)

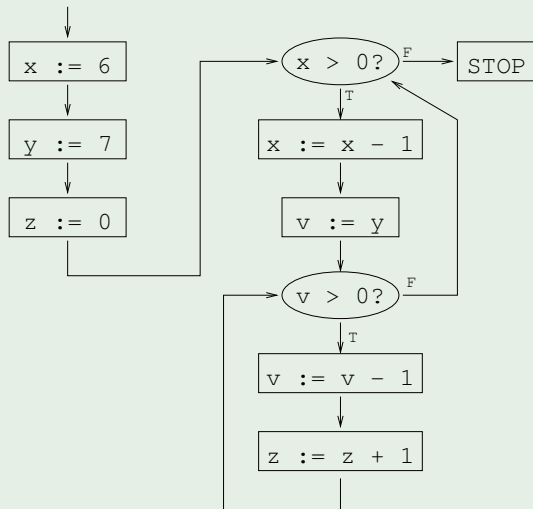

Example 1.4

```
x := 6;  
y := 7;  
z := 0;  
while x > 0 do  
  x := x - 1;  
  v := y;  
  while v > 0 do  
    v := v - 1;  
    z := z + 1
```

A WHILE Program and its Flow Diagram

Example 1.4

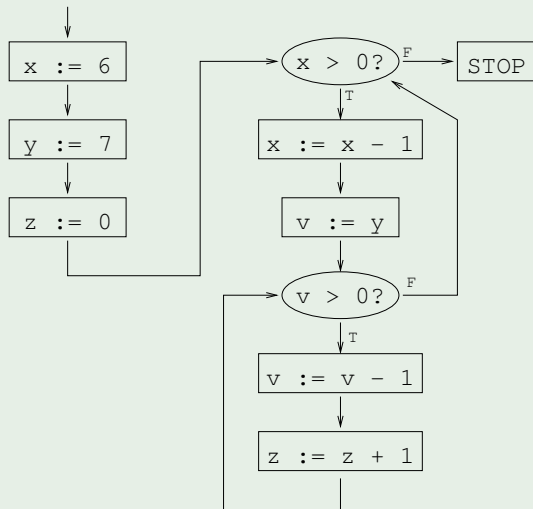

```
x := 6;  
y := 7;  
z := 0;  
while x > 0 do  
  x := x - 1;  
  v := y;  
  while v > 0 do  
    v := v - 1;  
    z := z + 1
```

A WHILE Program and its Flow Diagram

Example 1.4

```
x := 6;  
y := 7;  
z := 0;  
while x > 0 do  
  x := x - 1;  
  v := y;  
  while v > 0 do  
    v := v - 1;  
    z := z + 1
```

Effect: $z := x * y = 42$

- 3 The Imperative Model Language WHILE
- 4 Overview of the Lecture

(Preliminary) Overview of Contents

- ① Introduction to Program Analysis
- ② Dataflow analysis (DFA)
 - ① Available expressions problem
 - ② Live variables problem
 - ③ The DFA framework
 - ④ Solving DFA equations
 - ⑤ The meet-over-all-paths (MOP) solution
 - ⑥ Case study: the Java bytecode verifier
- ③ Abstract interpretation (AI)
 - ① Working principle
 - ② Program semantics & correctness
 - ③ Galois connections
 - ④ Applications (sign analysis, interval analysis, ...)
- ④ Interprocedural analysis
- ⑤ Pointer analysis
