Execution of Statements

Remember:

$c ::= \text{skip} \mid x := a \mid c_1; c_2 \mid \text{if } b \text{ then } c_1 \text{ else } c_2 \mid \text{while } b \text{ do } c \in \text{Cmd}$

Definition (Execution relation for statements)

For $c \in \text{Cmd}$ and $\sigma, \sigma' \in \Sigma$, the **execution relation** $\langle c, \sigma \rangle \rightarrow \sigma'$ is defined by the following rules:

$$\begin{array}{lcl} \text{(skip)} \frac{}{\langle \text{skip}, \sigma \rangle \rightarrow \sigma} & \text{(asn)} \frac{\langle a, \sigma \rangle \rightarrow z}{\langle x := a, \sigma \rangle \rightarrow \sigma[x \mapsto z]} & \\ \text{(seq)} \frac{\langle c_1, \sigma \rangle \rightarrow \sigma' \quad \langle c_2, \sigma' \rangle \rightarrow \sigma''}{\langle c_1; c_2, \sigma \rangle \rightarrow \sigma''} & \text{(if-t)} \frac{\langle b, \sigma \rangle \rightarrow \text{true} \quad \langle c_1, \sigma \rangle \rightarrow \sigma'}{\langle \text{if } b \text{ then } c_1 \text{ else } c_2, \sigma \rangle \rightarrow \sigma'} & \\ \text{(if-f)} \frac{\langle b, \sigma \rangle \rightarrow \text{false} \quad \langle c_2, \sigma \rangle \rightarrow \sigma'}{\langle \text{if } b \text{ then } c_1 \text{ else } c_2, \sigma \rangle \rightarrow \sigma'} & \text{(wh-f)} \frac{\langle b, \sigma \rangle \rightarrow \text{false}}{\langle \text{while } b \text{ do } c, \sigma \rangle \rightarrow \sigma} & \\ \text{(wh-t)} \frac{\langle b, \sigma \rangle \rightarrow \text{true} \quad \langle c, \sigma \rangle \rightarrow \sigma' \quad \langle \text{while } b \text{ do } c, \sigma' \rangle \rightarrow \sigma''}{\langle \text{while } b \text{ do } c, \sigma \rangle \rightarrow \sigma''} & & \end{array}$$

Determinism of Execution Relation

This operational semantics is well defined in the following sense:

Theorem

*The execution relation for statements is **deterministic**, i.e., whenever $c \in \text{Cmd}$ and $\sigma, \sigma', \sigma'' \in \Sigma$ such that $\langle c, \sigma \rangle \rightarrow \sigma'$ and $\langle c, \sigma \rangle \rightarrow \sigma''$, then $\sigma' = \sigma''$.*

Proof.

by structural induction on derivation trees

- 1 Repetition: Execution of Statements
- 2 Functional of the Operational Semantics
- 3 Summary: Operational Semantics
- 4 The Denotational Approach
- 5 Denotational Semantics of Expressions
- 6 Denotational Semantics of Statements

The determinism of the execution relation (Theorem 3.3) justifies the following definition:

Definition 4.1 (Operational functional)

The **functional of the operational semantics**,

$$\mathfrak{D}[\![\cdot]\!] : Cmd \rightarrow (\Sigma \dashrightarrow \Sigma),$$

assigns to every statement $c \in Cmd$ a partial state transformation $\mathfrak{D}[\![c]\!] : \Sigma \dashrightarrow \Sigma$, which is defined as follows:

$$\mathfrak{D}[\![c]\!]\sigma := \begin{cases} \sigma' & \text{if } \langle c, \sigma \rangle \rightarrow \sigma' \text{ for some } \sigma' \in \Sigma \\ \text{undefined} & \text{otherwise} \end{cases}$$

Functional of the Operational Semantics

The determinism of the execution relation (Theorem 3.3) justifies the following definition:

Definition 4.1 (Operational functional)

The **functional of the operational semantics**,

$$\mathfrak{D}[\![\cdot]\!] : Cmd \rightarrow (\Sigma \dashrightarrow \Sigma),$$

assigns to every statement $c \in Cmd$ a partial state transformation $\mathfrak{D}[\![c]\!] : \Sigma \dashrightarrow \Sigma$, which is defined as follows:

$$\mathfrak{D}[\![c]\!]\sigma := \begin{cases} \sigma' & \text{if } \langle c, \sigma \rangle \rightarrow \sigma' \text{ for some } \sigma' \in \Sigma \\ \text{undefined} & \text{otherwise} \end{cases}$$

Remark: $\mathfrak{D}[\![c]\!]\sigma$ can indeed be undefined
(consider e.g. $c = \text{while true do skip}$; see Corollary 3.2)

Definition 4.2 (Operational equivalence)

Two statements $c_1, c_2 \in Cmd$ are called (operationally) equivalent (notation: $c_1 \sim c_2$) if

$$\mathfrak{D}[[c_1]] = \mathfrak{D}[[c_2]].$$

Definition 4.2 (Operational equivalence)

Two statements $c_1, c_2 \in Cmd$ are called **(operationally) equivalent** (notation: $c_1 \sim c_2$) if

$$\mathfrak{D}[\![c_1]\!] = \mathfrak{D}[\![c_2]\!].$$

Thus:

- $c_1 \sim c_2$ iff $\mathfrak{D}[\![c_1]\!]\sigma = \mathfrak{D}[\![c_2]\!]\sigma$ for every $\sigma \in \Sigma$
- In particular, $\mathfrak{D}[\![c_1]\!]\sigma$ is undefined iff $\mathfrak{D}[\![c_2]\!]\sigma$ is undefined

“Unwinding” of Loops

Simple application of statement equivalence: test of execution condition in a `while` loop can be represented by an `if` statement

Lemma 4.3

For every $b \in BExp$ and $c \in Cmd$,

$\text{while } b \text{ do } c \sim \text{if } b \text{ then } (c; \text{while } b \text{ do } c) \text{ else skip.}$

“Unwinding” of Loops

Simple application of statement equivalence: test of execution condition in a `while` loop can be represented by an `if` statement

Lemma 4.3

For every $b \in BExp$ and $c \in Cmd$,

$\text{while } b \text{ do } c \sim \text{if } b \text{ then } (c; \text{while } b \text{ do } c) \text{ else skip.}$

Again: value of an expression determined by current state

Definition 4.4 (Denotational semantics of arithmetic expressions)

The (denotational) semantic functional for arithmetic expressions,

$$\mathcal{A}[\![\cdot]\!] : AExp \rightarrow (\Sigma \rightarrow \mathbb{Z}),$$

is given by:

$$\begin{array}{ll} \mathcal{A}[\![z]\!]\sigma := z & \mathcal{A}[\![a_1 + a_2]\!]\sigma := \mathcal{A}[\![a_1]\!]\sigma + \mathcal{A}[\![a_2]\!]\sigma \\ \mathcal{A}[\![x]\!]\sigma := \sigma(x) & \mathcal{A}[\![a_1 - a_2]\!]\sigma := \mathcal{A}[\![a_1]\!]\sigma - \mathcal{A}[\![a_2]\!]\sigma \\ & \mathcal{A}[\![a_1 * a_2]\!]\sigma := \mathcal{A}[\![a_1]\!]\sigma * \mathcal{A}[\![a_2]\!]\sigma \end{array}$$

Definition 4.5 (Denotational semantics of Boolean expressions)

The (denotational) semantic functional for Boolean expressions,

$$\mathfrak{B}[\cdot] : BExp \rightarrow (\Sigma \rightarrow \mathbb{B}),$$

is given by:

$$\begin{aligned}\mathfrak{B}[[t]]\sigma &:= t \\ \mathfrak{B}[[a_1 = a_2]]\sigma &:= \begin{cases} \text{true} & \text{if } \mathfrak{A}[[a_1]]\sigma = \mathfrak{A}[[a_2]]\sigma \\ \text{false} & \text{otherwise} \end{cases} \\ \mathfrak{B}[[a_1 > a_2]]\sigma &:= \begin{cases} \text{true} & \text{if } \mathfrak{A}[[a_1]]\sigma > \mathfrak{A}[[a_2]]\sigma \\ \text{false} & \text{otherwise} \end{cases} \\ \mathfrak{B}[[\neg b]]\sigma &:= \begin{cases} \text{true} & \text{if } \mathfrak{B}[[b]]\sigma = \text{false} \\ \text{false} & \text{otherwise} \end{cases} \\ \mathfrak{B}[[b_1 \wedge b_2]]\sigma &:= \begin{cases} \text{true} & \text{if } \mathfrak{B}[[b_1]]\sigma = \mathfrak{B}[[b_2]]\sigma = \text{true} \\ \text{false} & \text{otherwise} \end{cases} \\ \mathfrak{B}[[b_1 \vee b_2]]\sigma &:= \begin{cases} \text{false} & \text{if } \mathfrak{B}[[b_1]]\sigma = \mathfrak{B}[[b_2]]\sigma = \text{false} \\ \text{true} & \text{otherwise} \end{cases}\end{aligned}$$

- 1 Repetition: Execution of Statements
- 2 Functional of the Operational Semantics
- 3 Summary: Operational Semantics
- 4 The Denotational Approach
- 5 Denotational Semantics of Expressions
- 6 Denotational Semantics of Statements

Semantics of Statements I

- Now: semantic functional

$$\mathfrak{e}[\![\cdot]\!] : Cmd \rightarrow (\Sigma \dashrightarrow \Sigma)$$

Semantics of Statements I

- Now: semantic functional

$$\mathfrak{C}[\![\cdot]\!] : Cmd \rightarrow (\Sigma \dashrightarrow \Sigma)$$

- Same type as operational functional

$$\mathfrak{O}[\![\cdot]\!] : Cmd \rightarrow (\Sigma \dashrightarrow \Sigma)$$

(in fact, both will turn out to be the **same**

\Rightarrow **equivalence** of operational and denotational semantics)

Semantics of Statements I

- Now: semantic functional

$$\mathfrak{C}[\![\cdot]\!] : Cmd \rightarrow (\Sigma \dashrightarrow \Sigma)$$

- Same type as operational functional

$$\mathfrak{O}[\![\cdot]\!] : Cmd \rightarrow (\Sigma \dashrightarrow \Sigma)$$

(in fact, both will turn out to be the **same**

\implies **equivalence** of operational and denotational semantics)

- Inductive definition employs auxiliary functions:

- identity** on states: $\text{id}_\Sigma : \Sigma \dashrightarrow \Sigma : \sigma \mapsto \sigma$

- (strict) composition** of partial state transformations:

$$\circ : (\Sigma \dashrightarrow \Sigma) \times (\Sigma \dashrightarrow \Sigma) \rightarrow (\Sigma \dashrightarrow \Sigma)$$

where, for every $f, g : \Sigma \dashrightarrow \Sigma$ and $\sigma \in \Sigma$,

$$(g \circ f)(\sigma) := \begin{cases} g(f(\sigma)) & \text{if } f(\sigma) \text{ defined} \\ \text{undefined} & \text{otherwise} \end{cases}$$

- semantic conditional:**

$$\text{cond} : (\Sigma \rightarrow \mathbb{B}) \times (\Sigma \dashrightarrow \Sigma) \times (\Sigma \dashrightarrow \Sigma) \rightarrow (\Sigma \dashrightarrow \Sigma)$$

where, for every $p : \Sigma \rightarrow \mathbb{B}$, $f, g : \Sigma \dashrightarrow \Sigma$, and $\sigma \in \Sigma$,

$$\text{cond}(p, f, g)(\sigma) := \begin{cases} f(\sigma) & \text{if } p(\sigma) = \text{true} \\ g(\sigma) & \text{otherwise} \end{cases}$$

Definition 4.6 (Denotational semantics of statements)

The (denotational) semantic functional for statements,

$$\mathcal{C}[\![\cdot]\!] : Cmd \rightarrow (\Sigma \dashrightarrow \Sigma),$$

is given by:

$$\begin{aligned}\mathcal{C}[\![\text{skip}]\!] &:= \text{id}_{\Sigma} \\ \mathcal{C}[\![x := a]\!]\sigma &:= \sigma[x \mapsto \mathcal{A}[\![a]\!]\sigma] \\ \mathcal{C}[\![c_1; c_2]\!] &:= \mathcal{C}[\![c_2]\!] \circ \mathcal{C}[\![c_1]\!] \\ \mathcal{C}[\![\text{if } b \text{ then } c_1 \text{ else } c_2]\!] &:= \text{cond}(\mathcal{B}[\![b]\!], \mathcal{C}[\![c_1]\!], \mathcal{C}[\![c_2]\!]) \\ \mathcal{C}[\![\text{while } b \text{ do } c]\!] &:= \text{fix}(\Phi)\end{aligned}$$

where $\Phi : (\Sigma \dashrightarrow \Sigma) \rightarrow (\Sigma \dashrightarrow \Sigma) : f \mapsto \text{cond}(\mathcal{B}[\![b]\!], f \circ \mathcal{C}[\![c]\!], \text{id}_{\Sigma})$

Remarks:

- Definition of $\mathfrak{C}[[c]]$ given by **induction on syntactic structure** of $c \in Cmd$
 - in particular, $\mathfrak{C}[[\text{while } b \text{ do } c]]$ only refers to $\mathfrak{B}[[b]]$ and $\mathfrak{C}[[c]]$ (and not to $\mathfrak{C}[[\text{while } b \text{ do } c]]$ again)
 - note difference to $\mathfrak{D}[[c]]$:

$$(\text{wh-t}) \frac{\langle b, \sigma \rangle \rightarrow \text{true} \quad \langle c, \sigma \rangle \rightarrow \sigma' \quad \langle \text{while } b \text{ do } c, \sigma' \rangle \rightarrow \sigma''}{\langle \text{while } b \text{ do } c, \sigma \rangle \rightarrow \sigma''}$$

Remarks:

- Definition of $\mathfrak{C}[[c]]$ given by **induction on syntactic structure** of $c \in Cmd$
 - in particular, $\mathfrak{C}[[\text{while } b \text{ do } c]]$ only refers to $\mathfrak{B}[[b]]$ and $\mathfrak{C}[[c]]$ (and not to $\mathfrak{C}[[\text{while } b \text{ do } c]]$ again)
 - note difference to $\mathfrak{D}[[c]]$:

$$(\text{wh-t}) \frac{\langle b, \sigma \rangle \rightarrow \text{true} \quad \langle c, \sigma \rangle \rightarrow \sigma' \quad \langle \text{while } b \text{ do } c, \sigma' \rangle \rightarrow \sigma''}{\langle \text{while } b \text{ do } c, \sigma \rangle \rightarrow \sigma''}$$

- In $\mathfrak{C}[[c_1; c_2]] := \mathfrak{C}[[c_2]] \circ \mathfrak{C}[[c_1]]$, function composition \circ has to be **strict** since non-termination of c_1 implies non-termination of $c_1; c_2$

Remarks:

- Definition of $\mathfrak{C}[[c]]$ given by **induction on syntactic structure** of $c \in Cmd$
 - in particular, $\mathfrak{C}[[\text{while } b \text{ do } c]]$ only refers to $\mathfrak{B}[[b]]$ and $\mathfrak{C}[[c]]$ (and not to $\mathfrak{C}[[\text{while } b \text{ do } c]]$ again)
 - note difference to $\mathfrak{D}[[c]]$:

$$(\text{wh-t}) \frac{\langle b, \sigma \rangle \rightarrow \text{true} \quad \langle c, \sigma \rangle \rightarrow \sigma' \quad \langle \text{while } b \text{ do } c, \sigma' \rangle \rightarrow \sigma''}{\langle \text{while } b \text{ do } c, \sigma \rangle \rightarrow \sigma''}$$

- In $\mathfrak{C}[[c_1; c_2]] := \mathfrak{C}[[c_2]] \circ \mathfrak{C}[[c_1]]$, function composition \circ has to be **strict** since non-termination of c_1 implies non-termination of $c_1; c_2$
- In $\mathfrak{C}[[\text{while } b \text{ do } c]] := \text{fix}(\Phi)$, fix denotes a fixpoint operator (which remains to be defined)
 \implies **“fixpoint semantics”**

Remarks:

- Definition of $\mathfrak{C}[[c]]$ given by **induction on syntactic structure** of $c \in Cmd$
 - in particular, $\mathfrak{C}[[\text{while } b \text{ do } c]]$ only refers to $\mathfrak{B}[[b]]$ and $\mathfrak{C}[[c]]$ (and not to $\mathfrak{C}[[\text{while } b \text{ do } c]]$ again)
 - note difference to $\mathfrak{D}[[c]]$:

$$(\text{wh-t}) \frac{\langle b, \sigma \rangle \rightarrow \text{true} \quad \langle c, \sigma \rangle \rightarrow \sigma' \quad \langle \text{while } b \text{ do } c, \sigma' \rangle \rightarrow \sigma''}{\langle \text{while } b \text{ do } c, \sigma \rangle \rightarrow \sigma''}$$

- In $\mathfrak{C}[[c_1; c_2]] := \mathfrak{C}[[c_2]] \circ \mathfrak{C}[[c_1]]$, function composition \circ has to be **strict** since non-termination of c_1 implies non-termination of $c_1; c_2$
- In $\mathfrak{C}[[\text{while } b \text{ do } c]] := \text{fix}(\Phi)$, fix denotes a fixpoint operator (which remains to be defined)
 \implies **“fixpoint semantics”**

But: why **fixpoints**?
